                                                                                                                                       The invention relates to an isolated nucleic acid molecule consisting essentially of, and/or hybridizes under stringent conditions to a fully defined nucleotide sequence of 16-25 base pairs (bp; SEQ ID NO: 2471-2476), or its complement. The methods and compositions of the present invention are useful for the detection of the virus causing Severe Acute Respiratory Syndrome (SARS) in humans using a real-time quantitative polymerase chain reaction (PCR) assay. They can also be used in treating, ameliorating, managing or preventing SARS. This sequence corresponds to a partial SARS protein sequence from reading frame 3.
                                                ameliorating, or preventing the virus causing severe acute respiratory syndrome in humans using a real-time quantitative polymerase chain reaction assay.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The present invention relates to novel human Severe Acute Respiratory
                                                                                                                                                                                                                                                                                                                                                Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             (hSARS) virus,

Syndrome (hSARS) viral nucleic acid and protein sequences derived from a hSARS virus having China Center for Type Culture Collection Deposit Accession No. CCTC-V200303. The hSARS virus, nucleic acid and protein sequences are useful as vaccines for diagnosing or treating SARS. They are also useful in clinical and scientific research applications. The hSARS virus genome (ADT36557) was obtained and the amino acid sequences of all three reading frames were deduced. ADT36558 is the full-length protein encoded by the first reading frame and ADT36559-ADT36781 are the peptides from the first reading frame protein. ADT36781 is the full-length protein encoded by the second reading frame and ADT36781-ADT37278 are the peptides from the second reading frame and ADT36781-ADT37278 are the peptides from the second reading frame and ADT37279 is the full-length protein encoded by the third reading frame and ADT37279 is the ADT37649 are the peptides from the third reading frame and ADT37280-Sequence 8 AA; 8\$88888888888888888888

The invention relates to isolated polypeptides of the severe acute respiratory syndrome (SARS) coronavirus. The polypeptides include spike (S or E2), and (E or SM), membrane (M or E1), hemagidutinin-esterase (HE or E3), and mucleocapsid (N) polypeptides, and the ORFla and ORFlab classe) polypeptides and their proteolytic fragments. The invention also relates to antibodies which recognise the polypeptides; mucleic acids encoding the SARS virus polypeptides; primers specific for SARS virus nucleic acids; a double-stranded RNA molecule 10-30 nucleotides in length uncleic acids; and obuble-stranded RNA molecule 10-30 nucleotides in length conciles able to inactivate the SARS virus in a mammalian cell; an expression construct for recombinant expression of SARS virus spike protein; a viral vector for in vivo delivery of a SARS virus spike protein; a viral vector for in vivo delivery of a SARS virus spike protein; a viral vector for in vivo delivery of a SARS virus spike protein; a viral vector for in vivo delivery of a SARS virus spike protein; a viral vector for in vivo delivery of a SARS virus spike protein; a viral antigen. The invention additionally provides a vaccine for the reatment of prevention of SARS comprising an inactivated SARS virus antigens; methods of making inactivated SARS virus and vectories comprising one or more SARS virus antigens; method of respiratory virus antigens. The invention further encompasses a method of respiratory virus antigens. The invention further encompasses a method of centifying a therapeuticially active agent by measuring the effect of the using small molecule viral inhibitors. The SARS virus polypeptides, and method ency of antibodies against them, and SARS virus species and containing them are useful for dependence represents a containing them are useful for dependence represents a containing them are useful for dependence of the preparation, but was obstanced by a SARS coronavirus polymorpetide encoded by a SARS coronavirus polymorpetide encoded by a SARS coronavirus polym Novel isolated polypeptide e.g. spike polypeptide, Env polypeptide, of severe acute respiratory syndrome virus (SARS), useful as vaccine for Disclosure; SEQ ID NO 6878; 839pp; English WPI; 2004-766863/75.

The invention relates to a set of complementary peptide ligands generated from the human genome. The complementary peptides interact with their relevant target proteins encoded in the human genome. They can be used as reagents in drug discovery and as lead ligands to facilitate drug design and development. The present sequence is a complementary peptide provided
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        HIV; HIV-1; human immunodeficiency virus; env; pol; gag; nef; vpr; vpu; vif; tat; cytotoxic T lymphocyte; CTL; immune response; epitope; antigen; vaccine; HIV infection; immunisation; virucide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present invention describes a composition (I) comprising a prepared human immunodeficiency virus-1 (HIV-1) group comprising an amino acid sequence selected from 51 defined amino acid sequences (ABL25347 to ABP25397). (I) has virucide activity and can be used in vaccines. (I) may
                                                                                                                                                    A set of peptide ligands consisting of specific complementary peptides proteins encoded by genes of the human genome, useful in an assay for screening and identifying of one or more novel peptides which are drug
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Vaccine compositions comprising human immunodeficiency virus-1 (HIV-1) peptide groups, useful for vaccinating against HIV-1.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Score 27; DB 4; Leng

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ò
                                                                                                                                                                                                                                                                                                                                                                                                                  the present inventors a composition of the present inventors are defined amino acid sequence selected from 51 defined amino acid sequences (ABL25347 to ABP25397). (1) has virucide activity and can be used in vaccines. (1) may be used for immunising subjects against HIV-1 infections. The use of Stroup-based vaccines has several advantages over traditional vaccines of particularly when compared to the use of whole antigens in vaccine compositions. There is evidence that the immune response to whole antigens is directed largely toward variable regions of the antigen, antigens is directed largely toward variable regions of the antigen. Inclusion in an group-based vaccine may be selected from conserved regions of viral or tumour-associated antigens, which therefore reduces the likelihood of the scape mutants. Furthermore, immunosuppressive groups fast may be present in whole antigens can be avoided with the use of group-based vaccines. An additional advantage of an group-based vaccine approach is the ability to composition of the groups, achieving, for example, enhanced immunogenicity. Accordingly, the immune response can be modulated, as appropriate, for the target disease. Similar engineering of the response is not possible with traditional approaches. ABP11501 to ABP25412 represent peptide sequences used in the exemplification of the present invention. (Updated on 11-SEP-2003 to standardise OS field)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö

be used for immunising subjects against HIV-1 infections. The use of group-based vaccines has several advantages over traditional vaccines, particularly when compared to the use of whole antigens in vaccine compositions. There is evidence that the immune response to whole antigens is directed largely toward variable regions of the antigen, allowing for immune secape due to mutations. The groups for inclusion in an group-based vaccine may be selected from conserved regions of viral tumour-associated antigens, which therefore reduces the likelihood of the scape mutants. Furthermore, immunospressive groups that may be present in whole antigens can be avoided with the use of group-based vaccines. An additional advantage of an group-based vaccine approach is the ability to composition of the groups, achieving, for example, enhanced immunogenicity. Accordingly, the immune response can be modulated, as appropriate, for the target disease. Similar engineering of the response is not possible with traditional approaches. Abplification of the present represent peptide sequences used in the exemplification of the present invention. (Updated on 11-SEP-2003 to standardise OS field)

Treating or preventing a pathogen infection in a cell by administering to the cell chimeric molecules having a pathogen-detection domain or pathogen-induced product-detection domain and at least one effector domain.

Example 7; SEQ ID NO 410; 348pp; English,

The present invention describes a method for treating or preventing a pathogen infection in a cell. The method comprises administering to the cell chimeric molecules (I) having at least one pathogen-detection domain or pathogen-induced product-detection domain and at least one effector

ö detection domain is not naturally bound to the effector domain. In the presence of a pathogen or pathogen-induced product in the cell, the chimeric molecules bind to the pathogen and activate the effector domain. Also described: (1) treating or preventing the spread of a pathogen infection in an organism; (2) a chimeric molecule (1) having at least one pathogen-detection domain or pathogen-induced product-detection domain and at least one effector domain; (3) an agent having at least one pathogen-interacting or pathogen-induced product-interacting molecular structure and at least one effector—mediating molecular structure; and (4) an assay for detecting a pathogen infection in a cell or organism. (1) has antimicrobial activity, and can be used in gene therapy. The method is useful for treating or preventing a pathogen infection in a cell or organism. The present sequence is used in the exemplification of the present invention. Gaps The pathogen-detection domain or pathogen-induced product-. . 100.0%; Score 27; DB 7; Length 10; 100.0%; Pred. Treating or preventing a pathogen infection in a cell by administering the cell chimeric molecules having a pathogen-detection domain or pathogen-induced product-detection domain and at least one effector domain

t

Example 7; SEQ ID NO 222; 348pp; English.

The present invention describes a method for treating or preventing a pathogen infection in a cell. The method comprises administering to the cell chimeric molecules (1) having at least one pathogen-detection domain or pathogen-induced product-detection domain and at least one effector domain. The pathogen-induced product of celector domain or pathogen-induced product detection domain or pathogen-induced product in the presence of a pathogen or pathogen-induced product in the cell, the chimeric molecules bind to the pathogen and activate the effector domain. Also described: (1) treating or preventing the spread of a pathogen infection in an organism; (2) a chimeric molecule (1) having at least one

```
pathogen-detection domain or pathogen-induced product-detection domain and at least one effector domain; (3) an agent having at least one pathogen-induced product-interacting molecular structure and at least one effector-mediating molecular structure; and (4) an assay for detecting a pathogen infection in a cell or organism. (I) has antimicrobial activity, and can be used in gene therapy. The method is useful for treating or perventing a pathogen infection in a cell or organism. The present sequence is used in the exemplification of

t Treating or preventing a pathogen infection in a cell by administering the cell chimeric molecules having a pathogen-detection domain or pathogen-induced product-detection domain and at least one effector domain

Example 7; SEQ ID NO 354; 348pp; English.

The present invention describes a method for treating or preventing a pathogen infection in a cell. The method comprises administering to the cell chimeric molecules (1) having at least one pathogen-detection domain or pathogen-induced product-detection domain and at least one effector domain. The pathogen-detection domain or pathogen-induced product detection domain is not naturally bound to the effector domain. In the presence of a pathogen or pathogen-induced product in the cell, the chimeric molecules bind to the pathogen and activate the effector domain. Also described: (1) treating or preventing the spread of a pathogen in fection in an organism; (2) a chimeric molecule (1) having at least one pathogen-detection domain or pathogen-induced product-detection domain and at least one effector domain; (3) an agent having at least one pathogen-interacting or pathogen-induced product-interacting molecular

```

The present invention describes a method for treating or preventing a pathogen infection in a cell. The method comprises administering to the cell chimeric molecules (I) having at least one pathogen-detection domain or pathogen-induced product-detection domain and at least one effector domain. The pathogen-detection domain or pathogen-induced product.

C detection domain is not naturally bound to the effector domain. In the presence of a pathogen or pathogen-induced product in the cell, the chimeric molecules bind to the pathogen and activate the effector domain.

Also described: (1) treating or preventing the spread of a pathogen or pathogen-induced product-detection domain or pathogen-induced product-detection and at least one effector mediating molecular structure; and at least one effector mediating molecular structure; and contracture and at least one effector mediating molecular structure; and contracture and at least one effector mediating molecular structure; and contracture and at least one effector mediating molecular structure; and contracture and at least one effector mediating molecular structure; and contracture and at least one effector mediating molecular structure; and contracture and at least one effector mediating molecular structure; and contracture and at least one effector mediating molecular structure; and contracture and at least one effector mediating molecular structure; and contracture and at least one effector mediating molecular structure; and contracture and at least one effector mediating molecular structure; and contracture and at least one effector mediating molecular structure; and contracture mediation of method is useful for treating or preventing a pathogen infection in a cell or organism. The present invention in the exemplification in a cell or organis Example 7; SEQ ID NO 340; 348pp; English.

```

The present invention describes a method for treating or preventing a pathogen infection in a cell. The method comprises administering to the cell chimeric molecules (I) having at least one pathogen-detection domain or pathogen-induced product detection domain and at least one effector domain. The pathogen-detection domain or pathogen-induced product to the pathogen-induced product to the pathogen-induced product in the cell, the presence of a pathogen or pathogen induced product in the cell, the presence of a pathogen or pathogen and activate the effector domain. On the pathogen induced product in the cell, the chimeric molecules bind to the pathogen and activate the effector domain. On the pathogen and activate the effector domain. On the pathogen infection in an organism, (2) a chimeric molecule (1) having at least one pathogen-induced product-interacting domain compathogen-interacting or pathogen-induced product-interacting molecular structure; and at least one effector mediating molecular structure; and (4) an assay for detecting a pathogen infection in a cell or organism. (1) has antimicrobial activity, and can be used in gene therapy. The method is useful for treating or preventing a pathogen infection in a compation of the present sequence is used in the exemplification of Gaps ö 100.0%; Score 27; DB 7; Length 10; Similarity 100.0%; Pred. The present invention describes a method for treating or preventing a pathogen infection in a cell. The method comprises administering to the cell chimeric molecules (1) having at least one pathogen-detection domain or pathogen-induced product-detection domain and at least one effector domain. The pathogen-fetection domain or pathogen-induced product-detection domain is not naturally bound to the effector domain. In the presence of a pathogen or pathogen and activate the effector domain. Also described: (1) treating or preventing the spread of a pathogen inflection in an organism; (2) a chimeric molecule (1) having at least one pathogen-detection domain or pathogen-induced product-detection domain and at least one pathogen-induced product-detection domain pathogen-induced product-detection domain pathogen-interacting or pathogen-induced product-interacting molecular pathogen-interacting or pathogen-induced product-interacting molecular

structure and at least one effector-mediating molecular structure; and (4) an assay for detecting a pathogen infection in a cell or organism. (1) has antimicrobial activity, and can be used in gene therapy. The method is useful for treating or preventing a pathogen infection in a cell or organism. ```
The present invention describes a method for treating or preventing a pathogen infection in a cell. The method comprises administering to the cell chimeric molecules (I) having at least one pathogen-detection domain or pathogen-induced product-detection domain and at least one effector domain. The pathogen-detection domain and at least one effector commain is not naturally bound to the effector domain. In the presence of a pathogen or pathogen-induced product in the cell, the presence of a pathogen or pathogen and activate the effector domain. The pathogen or preventing the spread of a pathogen or preventing the spread of a pathogen or infection in an organism; (2) a chimeric molecule (1) having at least one pathogen-induced product-detection domain or pathogen-induced product-detection domain or pathogen-induced product-detection domain or pathogen-induced product-detection domain or pathogen-induced product-interacting molecular structure, and at least one effector mediating molecular structure; and (4) has antimicrobial activity, and can be used in gene therapy. The method is useful for treating or preventing a pathogen infection in a cell or organism. The present sequence is used in the exemplification of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Treating or preventing a pathogen infection in a cell by administering to the cell chimeric molecules having a pathogen-detection domain or pathogen-induced product-detection domain and at least one effector
                                                                                                                                                                                                                                                                                        pathogen infection; chimeric molecule; pathogen-detection domain; pathogen-induced product-detection domain; effector domain; antimicrobial; gene therapy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 100.0%; Score 27; DB 7; Length 10; 100.0%; Pred. ```
The present invention describes a method for treating or preventing a pathogen infection in a cell. The method comprises administering to the cell chimeric molecules (I) having at least one pathogen-detection domain or pathogen-detection domain and at least one effector domain. The pathogen-detection domain or pathogen-induced product cheection domain is not naturally bound to the effector domain. In the presence of a pathogen or pathogen-induced product in the cell, the chimeric molecules bind to the pathogen and activate the effector domain. Also described: (1) treating or preventing the spread of a pathogen infection in an organism; (2) a chimeric molecule (I) having at least one pathogen-induced product-detection domain or pathogen-induced product-detection and at least one effector—mediating molecular structure; and at least one effector—mediating molecular structure; and at least one effector—mediating molecular structure; and at least one affector—mediating molecular structure; and at least one affector—mediating molecular structure; and at least one attority, and can be used in gene therapy. The present invention describes a method for treating or preventing a pathogen infection in a cell. The method comprises administering to the cell chimeric molecules (I) having at least one pathogen-detection domain or pathogen-induced product-detection domain and at least one effector domain. The pathogen or pathogen in to naturally bound to the effector domain. In the presence of a pathogen or pathogen-induced product in the cell, the presence of a pathogen or pathogen-induced product in the effector domain. In the presence of a pathogen or pathogen-induced product in the effector domain. Infection in an organism; (3) a chimeric molecule (I) having at least one pathogen-detection domain or pathogen-induced product-detection domain or pathogen-induced product-detection domain at least one effector domain; (3) an agent having at least one pathogen-induced product-interacting molecular structure and at least one effector—mediating molecular structure; and (4) an assay for detecting a pathogen infection in a cell or organism. (1) has antimicrobial activity, and can be used in gene therapy. The method is useful for treating or preventing a pathogen infection in a cell or organism. Cell or organism. The present invention is used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Treating or preventing a pathogen infection in a cell by administering to the cell chimeric molecules having a pathogen-detection domain or pathogen-induced product-detection domain and at least one effector
                                                                                                                                                                                              pathogen infection; chimeric molecule; pathogen-detection domain; pathogen-induced product-detection domain; effector domain; antimicrobial; gene therapy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            100.0%; Score 27; DB 7; Length 10; 100.0%; Pred.                                                                                                                                                                                                                                                                                                                                                                                                                                                       The present invention describes a method for treating or preventing a pathogen infection in a cell. The method comprises administering to the cell conservation conservation of the cell conservation of the cell conservation domain or pathogen-induced product-detection domain at least one effector domain. The pathogen-detection domain or pathogen-induced product conservation domain is not naturally bound to the effector domain. In the presence of a pathogen or pathogen induced product in the cell, the chimeric molecules bind to the pathogen and activate the effector domain. Also described: (1) treating or preventing the spread of a pathogen conservation domain or pathogen-induced product-detection domain at least one effector-mediating molecular structure, and at least one effector-mediating molecular structure, and at least one effector-mediating molecular structure, and (4) an assay for detecting a pathogen infection in a cell or organism. (2) has antimicrobial activity, and can be used in gene therapy. The
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö
                                                                                                                                                                                                                                                                                                                                                          Treating or preventing a pathogen infection in a cell by administering to the cell chimeric molecules having a pathogen-detection domain or pathogen-induced product-detection domain and at least one effector
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                method is useful for treating or preventing a pathogen infection in a cell or organism. The present sequence is used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps

The present invention describes a method for treating or preventing a pathogen infection in a cell. The method comprises administering to the cell chimeric molecules (1) having at least one pathogen-detection domain cor pathogen-induced product-detection domain and at least one effector domain. The pathogen-induced product in the cell the pathogen or pathogen-induced product in the cell, the presence of a pathogen or pathogen-induced product in the cell, the chimeric molecules bind to the pathogen and activate the effector domain. Also described: (1) treating or preventing the spread of a pathogen infection in an organism; (2) a chimeric molecule (1) having at least one pathogen-induced product-detection domain at least one effector domain; (3) an agent having at least one pathogen-induced product-detection domain at least one effector domain; (3) an agent having at least one gructure and at least one effector-mediating molecular structure; and can be used in gene therapy. The
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     method is useful for treating or preventing a pathogen infection in a cell or organism. The present sequence is used in the exemplification of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Treating or preventing a pathogen infection in a cell by administering the cell chimeric molecules having a pathogen-detection domain or pathogen-induced product-detection domain and at least one effector
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps
pathogen infection; chimeric molecule; pathogen-detection domain; pathogen-induced product-detection domain; effector domain; antimicrobial; gene therapy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                pathogen infection; chimeric molecule; pathogen-detection domain; pathogen-induced product-detection domain; effector domain;

The present invention describes a method for treating or preventing a pathogen infection in a cell. The method comprises administering to the cell chimeric molecules (1) having at least one pathogen-detection domain or pathogen-induced product detection domain and at least one effector domain. The pathogen-detection domain or pathogen-induced product in the pathogen-induced product in the commandation for the pathogen-induced product in the presence of a pathogen or pathogen induced product in the cell; the chimeric molecules bind to the pathogen and activate the effector domain. Commerced to the pathogen induced product in the cell; the chimeric molecules bind to the pathogen and activate the effector domain. Compathogen-detection domain or pathogen-induced product-detection domain. Compathogen-induced product-detection domain compathogen-induced product-detection domain compathogen-induced product-interacting molecular structure and at least one effector mediating molecular structure; and (1) has an assay for detecting a pathogen infection in a cell or organism. (1) has antimicrobial activity, and can be used in gene therapy. The coll or organism. The present sequence is used in the exemplification of
                                                                                                                                                                                                                                                                                                                                                                                                                            Treating or preventing a pathogen infection in a cell by administering to the cell chimeric molecules having a pathogen-detection domain or pathogen-induced product-detection domain and at least one effector
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   pathogen infection; chimeric molecule; pathogen-detection domain; pathogen-induced product-detection domain; effector domain; antimicrobial; gene therapy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Length 10;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present invention describes a method for treating or preventing a pathogen infection in a cell. The method comprises administering to the cell chimneric molecules (1) having at least one pathogen-detection domain or pathogen-induced product-detection domain and at least one effector domain. The pathogen-detection domain or pathogen-induced product detection domain is not naturally bound to the effector domain. In the presence of a pathogen or pathogen nor pathogen in the cell, the chimneric molecules bind to the pathogen and activate the effector domain. Also described: (1) treating or preventing the spread of a pathogen infection in an organism; (2) a chimeric molecule (1) having at least one pathogen-detection domain or pathogen-induced product-detection domain and at least one and at least one effector domain; (3) an agent having at least one
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Treating or preventing a pathogen infection in a cell by administering to the cell chimeric molecules having a pathogen-detection domain or pathogen-induced product-detection domain and at least one effector
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               method is useful for treating or preventing a pathogen infection in a cell or organism. The present sequence is used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          and at least one effector domain; (3) an agent having at least one pathogen-interacting molecular structure and at least one effector-mediating molecular structure; and (4) an assay for detecting a pathogen infection in a cell or organism. (1) has antimicrobial activity, and can be used in gene therapy. The
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps

The method comprises administering to the cell chimeric molecules (1) having at least one pathogen-detection domain or pathogen-detection domain and at least one effector domain. The pathogen-detection domain or pathogen-induced product detection domain is not naturally bound to the effector domain. In the presence of a pathogen or pathogen-induced product in the cell, the presence of a pathogen or pathogen and activate the effector domain. The pathogen infection in an organism; (2) a chimeric molecule (1) having at least one pathogen-interacting or preventing the spread of a pathogen infection in an organism; (2) a chimeric molecule (1) having at least one pathogen-induced product-interacting molecular structure; and at least one effector mediating molecular structure; and (4) an assay for detecting or pathogen-induced product-interacting molecular structure; and (4) an assay for detecting a pathogen infection in a call or organism. (1) has antimicrobial activity, and can be used in gene therapy. The method is useful for treating or preventing a pathogen infection in a cell or organism. The present sequence is used in the exemplification of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö
                                                                                                                                                                                                                                                                                                                                      Treating or preventing a pathogen infection in a cell by administering to the cell chimeric molecules having a pathogen-detection domain or pathogen-induced product-detection domain and at least one effector domain.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps

The present invention describes a method for treating or preventing a pathogen infection in a cell. The method comprises administering to the cell chimeric molecules (I) having at least one pathogen-detection domain or pathogen-induced product-detection domain and at least one effector domain. The pathogen-induced domain or pathogen-induced product in the effector domain. In the presence of a pathogen or pathogen-induced product in the cell, the presence of a pathogen or pathogen and activate the effector domain. Or pathogen induced product in the cell, the chimeric molecules bind to the pathogen and activate the effector domain. The pathogen or preventing the spread of a pathogen or infection in an organism, (2) a chimeric molecule (I) having at least one pathogen-induced product-detection domain or pathogen-induced product-detection domain or pathogen-induced product-detection domain companies and at least one effector mediating molecular structure, and (4) an assay for detecting a pathogen infection in a cell or organism. (I) has antimicrobial activity, and can be used in gene therapy. The method is useful for treating or preventing a pathogen infection in a cell or organism. The present sequence is used in the exemplification of
                                                                                                                                                                                                                                                                                                                                                 Treating or preventing a pathogen infection in a cell by administering to the cell chimeric molecules having a pathogen-detection domain or pathogen-induced product-detection domain and at least one effector
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Hyaluronate, treatment, wound healing, burns, skin graft, ulcer, tissue regeneration, matrix, matrices, fibronectin, cancer, osteoporosis,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      .

04-JUL-1996

New isolated enhancer and transcription factor - used for increasing the recombinant expression of proteins, particularly in plants, e.g. for increasing production or providing pest resistance.

Disclosure; Fig 7B; 65pp; English.

Craig WS, Mullen DG;

AAM39790-W39796 are AT hook motifs used in the characterisation of a

novel tobacco palindromic element binding factor, (PABF). This PABF binds

to the sequence (AATT)n where n at least 2. The (AATT) sequence has cisacting, non-specific enhancer activity. It can be linked to a

concreased expression of proteins such as nutritionally important

concreased expression of proteins such as nutritionally important

concreased expression of proteins uch as nutritionally important

concreased expression of proteins such as nutritionally important

concreting, prowth promoting factors, proteins for early flowering in

plants, proteins giving protection to the plant under certain

conferring resistance to and a proteins conferring resistance to metals

conferring resistance to fungi, bacteria, viruses, insects and nematodes,

proteins of specific commercial value, e.g. enzymes involved in metabolic

conferring as BESP synthase. The PABF polypeptides act as

transcription factor and bind to the (AATT) repeat element to further

Compositions comprising a cross linked hyaluronate polymer and a peptide having cell attachment promoting activity can be used for treating wounds such as severe burns, skin graft donor sites, decubitus ulcers, diabetic ulcers, surgical incisions and keloid-forming wounds. They can also be used for inducing tissue regeneration. The conjugate acts as a temporary replacement matrix that encourages cell migration into the wound and speeds healing. As the wound heals, the conjugate is slowly broken down by the migrating cells and is replaced by a natural matrix. The peptides contain the amino acids selected from (D-)Arg, (D-)Lys, (D-)Drn and D-)HomoArg. The peptides can be used to competetively inhibit the binding of cells to RGD containing adhesive proteins such as fibronectin for the treatment of e.g cancer, osteoporosis or thrombosis. Peptides are described in AAR98433-36, AAR98438-43 and AAR98445-53
                                                                                                                                                                        Crosslinked hyaluronate-RGD peptide conjugates - prepd. by epoxide, sodium periodate or tresyl chloride methods, provide temporary matrix for wound healing and tissue regeneration.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Palindromic element binding factor; PABF; tobacco; cis-acting element; transcription enhancer; heterologous promoter; AATT repeat element;

to the sequence (AATT)n where n at least 2. The (AATT)n sequence has cisacting, non-specific enhancer activity. It can be linked to a heterologous promoter operably linked with a gene to increase expression of the gene in a cell, particularly in plants. It can provide for increased expression of proteins such as nutritionally important contents, proteins growth promoting factors, proteins for early flowering in plants, proteins giving protection to the plant under certain environmental conditions, e.g. proteins conferring resistance to metals or other toxic substances, such as herbicides or pesticides, stress-created proteins which confer tolerance to temperature extremes, proteins conferring resistance to fund; bacteria, viruses, insects and nematodes, proteins of specific commercial value, e.g. enzymes involved in metabolic proteins or as pathways, such as EMSP synthase. The PABF polypeptides act as transcription factor and bind to the (AATT) repeat element to further boost the activity of the enhancer.

Inhibition of wound contraction - with peptide derivatives rich in basic

Claim 7; Col 24; 16pp; English amino acids.

The invention provides methods for reduction or inhibition of wound contraction that comprises administration of a peptide having more than 3 consecutive basic amino acid residues. Alternatively, the peptide contains the amino acid sequence Alternatively, the peptide contains the amino acid sequence Arg-Gly-Asp and a basic amino acid sequence, or the peptide comprises 6-30 amino acids in which at least 4 out of a sequence of 6 consecutive amino acids are basic amino acids. The method is used to allow normal tissue regeneration without excessive scar formation which, in the case of large wounds, can result in loss of joint motion or major body deformation. Sequences AAW86170 to AAW86183 represent specifically claimed examples of peptides that can be used in method of the invention

The present invention describes a method for treating or preventing a pathogen infection in a cell. The method comprises administering to the cell chimeric molecules (I) having at least one pathogen-detection domain or pathogen-induced product-detection domain and at least one effector domain. The pathogen-detection domain or pathogen-induced product detection domain is not naturally bound to the effector domain. In the creating or pathogen-induced product in the cell, the presence of a pathogen or pathogen and activate the effector domain. Commeric molecules bind to the pathogen and activate the effector domain. Commeric molecules bind to the pathogen and activate the effector domain. Commeric molecule (1) treating or preventing the spread of a pathogen cinfection in an organism; (2) a chimeric molecule (1) having at least one pathogen-induced product-detection domain companies, companies
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Treating or preventing a pathogen infection in a cell by administering to the cell chimeric molecules having a pathogen-detection domain or pathogen-induced product-detection domain and at least one effector
                                                                                                                                                                                                                               pathogen infection; chimeric molecule; pathogen-detection domain; pathogen-induced product-detection domain; effector domain; antimicrobial; gene therapy.
                                                                                                                                                                        Anti-pathogen related amino acid sequence SEQ ID NO:213.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Example 7; SEQ ID NO 213; 348pp; English

compound and a transport group. The transport group comprises a spaced poly-Arginine based peptide of formula given in the specification. The spaced poly-Arginine based peptide acts as a cellular membrane transport signal and effects transport of the biologically active compound across the membrane. The conjugate is also useful in therapeutic, prophylactic biologically active compounds across the biologically active compounds across the biological membrane and into animal epithelial or endothelial tissues. The arginine residue of the conjugate provides an enhanced transport of drugs and are a part of the polypeptide that provides suitable spacing between arginine residues. The transport groups deliver an agent across the stratum corneum, which previously had been a nearly impenetrable barrier to drug delivery. The ability of the conjugate to obtain penetration of skin layers improves

Compositions comprising a cross linked hyaluronate polymer and a peptide having cell attachment promoting activity can be used for treating wounds such as severe burns, skin graft donor sites, decubitus ulcers, diabetic ulcers, surgical incisions and keloid-forming wounds. They can also be used for inducing tissue regeneration. The conjugate acts as a temporary replacement matrix that encourages cell migration into the wound and speeds healing. As the wound heals, the conjugate is slowly broken down by the migrating cells and is replaced by a natural matrix. The peptides contain the amino acids selected from (D-)Arg, (D-)Lys, (D-)Orn and (D-)HomoArg. The peptides can be used to competetively inhibit the binding of cells to RGD containing adhesive proteins such as fibronectin for the treatment of e.g cancer, osteoporosis or thrombosis. Peptides are
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Crosslinked hyaluronate-RGD peptide conjugates - prepd. by epoxide, sodium periodate or tresyl chloride methods, provide temporary matrix for wound healing and tissue regeneration.
                                                                                                                                                                                                                                                                                                                                                                   burns; skin graft; ulcer;

Compositions comprising a cross linked hyaluronate polymer and a peptide having cell attachment promoting activity can be used for treating wounds such as severe burns, skin graft donor sites, decubitus ulcers, diabetic ulcers, surgical incisions and keloid- forming wounds. They can also be used for inducing tissue regeneration. The conjugate acts as a temporary replacement matrix that encourages cell migration into the wound and speeds healing. As the wound heals, the conjugate is slowly broken down by the migrating cells and is replaced by a natural matrix. The peptides contain the amino acid sequence Y-GIy-Asp, where Y is Arg or D-Arg, at least two more amino acids selected from (D-)Arg, (D-)Lys, (D-)Orn and (D-)Howard Conjugate is a conjugate in the binding of cells to RGD containing adhesive proteins such as fibronectin for the treatment of e.g cancer, osteoporosis or thrombosis. Peptides are

```
The invention relates to a vaccine for alleviating or preventing autoimmune disorders induced by infection with Epstein-Barr virus (EBV). It comprises EBV or a component in a carrier for administration of the virus or viral component to alleviate or prevent the autoimmune disorder. Also claimed are: (1) a diagnostic test kit comprising: (a) reagents of which can be used to detect levels of antibodies to EBV, indicators of EBV infection of cells, or levels of EBV DNA or protein in a patient; (b) control samples from individuals not at risk of developing an autoimmune disease from those at lower risk of developing control samples to distinguish individuals at higher risk of developing an autoimmune disease; and (2) a method for screening for genetic markers or risk factors for development of autoimmune disease; and (2) a method for screening for genetic markers or risk factors for development of autoimmune diseases induced by infection with EBV comprising comparing the responses of different strains of the same species of an animal vaccinated with EBV or a component to induce an autoimmune response in at least one of the strains of inferting the differences in the genetics of the different strains or used for the prevention, diagnosis, and treatment of autoimmune diseases consect diabetes mellitus, Megener's granulomatosia, etc. The autoimmune diseases having EBV as an etiological agent. The autoimmune diseases consecuence represents a peptide drived from Epstein-Barr virus. Reagents are used to detect antibodies to this peptide in a specifically claimed diagnostic test. (Updated on 27-AUG-2003 to correct OS field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Use of Epstein-Barr virus or component(s) - for developing product(s) which can be used for preventing, diagnosing, treating or determining risk of developing autoimmune disease.
                                                                                                                                                                                                    Epstein-Barr virus; diagnostic test; autoimmune disease; vaccine; infection; antibody; screening; genetic marker.
                                                                                                                                                              Epstein-Barr virus derived peptide #19.

Novel vaccine for alleviating or preventing autoimmune disorders induced Epstein-Barr virus (EBV) infection e.g. systemic lupus erythematosus, juvenile onset diabetes mellitus, comprises EBV virus or its component.

Claim 8; Page 61; 114pp; English.

pernicious and haemolytic anaemia, lupcid hepatitis, demyelinating disease, multiple sclerosis, subacute cutaneous lupus erythematosus, hypoparathyroidism, Dressler's syndrome, myasthenia gravis, autoimmune idiopathic thrombocytopenic purpura, autoimmune pemphigus vulgaris, pemphigoid, dermatitis herpetiformis, alopecia areata, autoimmune cystitis, pemphigoid, scleroderma, progressive systemic sclerosis, rosts ryndrome (calcinosis, Rayand's oseophagoal dysmotility, sclerodactyly and telangectasis), adult onset diabetes mellitus (Type II diabetes), male or female autoimmune infertility, ankylosing spondylitis, ulcerative colltis, Crohn's disease, mixed connective tissue disease, The present invention relates to a vaccine for alleviating or preventing autoimmune disorders induced by infection with Epstein-Barr virus (EBV), comprising EBV or its component in a carrier. The vaccine is useful for preventing or alleviating autoimmune disorders induced by EBV, e.g. systemic lupus erythematosus (SLE), Sjogren's syndrome, juvenile onset diabetes mellitus, rheumatoid arthritis, Wegener's granulomatosis, inflammatory bowel disease, polymyositis, dermatomyositis, multiple endocrine failure, Schmidt's syndrome, autoimmune uveitis, Addison's disease, adrenalitis, primary blilary cirrhosis, Graves' disease, thyroiditis, Hashimoto's thyroiditis, autoimmune thyroid disease,

Claim 14; Page 83; 107pp; English

The present invention describes a method for producing micelles with entraped therapeutic agents. The method comprises: (1) combining negatively charged agent with a cationic lipid in a ratio where 30-90 % of the negatively charged atoms are neutralised by positive charges on

lipid molecules to form an electrostatic micelle complex in 20-80 % ethanol; and (2) combining the micelle complex of (a) with fusogenic-karyophilic peptide conjugates in a 0.0-0.3 ratio, therefore producing micelles with entrapped therapeutic agents. Also described is a method for delivering a therapeutic agent in vivo, comprising the administration of the micelles ABB74256 to ABB74658 represent specifically claimed nuclear localisation signal (NLS) peptides for use in the method as the fusogenic-karyophilic peptides. The micelles produced can have cytostatic and antitumour activities. The peptide-lipid-polynucleotide complexes produced are useful for inhibiting the progression of neoplastic diseases. The invention relates to the field of gene therapy and is directed toward methods for producing peptide-lipid-polynucleotide complexes suitable for delivery of polynucleotides. The encapsulated molecules display therapeutic efficacy in eradicating solid tumours including but not limited to breast carcinoma or prostate carcinoma. ABB74255 to ABB74255 are used in the exemplification of the present ö BBV; viral; Epstein-Barr virus nuclear antigen; vaccine; autoimmune disorder; Epstein-Barr virus infection; diabetes mellitus; arthritis; multiple sclerosis; dermatitis; psoriasis; asthma; anaemia; Gaps . 0 100.0%; Score 27; DB 5; Length 12; 100.0%; Pred. New vaccine for alleviating or preventing autoimmune disorders induced by Epstein-Barr virus (EBV) infection, e.g. systemic lupus erythematosus, comprises EBV or its component in a pharmaceutical carrier.

Claim 8, Page 17; 30pp; English

```
The invention relates to a new vaccine for alleviating or preventing autoimmune disorders induced by infection with Epstein-Barr virus (EBV). The vaccine comprises EBV or its component in a pharmaceutical carrier for administration of the virus or viral component in an amount and mode of administration to alleviate or prevent the autoimmune disorders. The composition and methods are useful for dispnosing, preventing or treating autoimmune diseases caused by Epstein-Barr virus, such as systemic lupus erythematosus, Sjogren's syndrome, rheumatoid arthritis, juvenile onset dispetes mellitus, Wegener's granulomatosis or inflammatory bowel dispetes mellitus, and so be used in screening of therapeutics for prevention or alleviation of autoimmune disorders induced by EBV infection. The present sequence represents an Epstein-Barr virus nuclear antigen 1, antigenic peptide used to make the vaccine of the invention.
                                                                                                                                                                                                                                                                                                                                                 ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Crosslinked hyaluronate-RGD peptide conjugates - prepd. by epoxide, sodium periodate or tresyl chloride methods, provide temporary matrix for wound healing and tissue regeneration.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Compositions comprising a cross linked hyaluronate polymer and a peptide having cell attachment promoting activity can be used for treating wounds such as severe burns, skin graff donor sites, decubitus ulcers, diabetic ulcers, surgical incisions and keloid- forming wounds. They can also be used for inducing tissue regeneration. The conjugate acts as a temporary replacement matrix that encourages cell migration into the wound and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Hyaluronate; treatment; wound healing; burns; skin graft; ulcer;

speeds healing. As the wound heals, the conjugate is slowly broken down by the migrating cells and is replaced by a natural matrix. The peptides contain the amino acid sequence Y-Gly-Asp, where Y is Arg or D-Arg, at least two more amino acids selected from (D-)Arg, (D-)Lys, (D-)Crn and (D-)HomoArg. The peptides can be used to competetively inhibit the binding of cells to RGD containing adheaive proteins such as fibronectin for the treatment of e.g cancer, osteoporosis or thrombosis. Peptides are described in AAR98433-36, AAR98438-43 and AAR98445-53

New selective adsorbent carrying peptide(s) that mimic complement Clg -useful for removing immune complexes, viruses etc. from blood, plasma and Pfueller B; Schoessler W, Hiepe F, Hentschel C,

.; 0

Claim 7; Col 1; 4pp; German.

serum,

complexes, viruses, other pathogens, endotoxins, C-reactive proteins, amyloid, DNA, cardiolipids, fibronectin, fibrinogen and other biological materials. The adsorbent comprises a solid carrier to which are bound synthetic peptides which minc the active center of protein C1g. The adsorbent is useful for eliminating specified materials from blood, plasma and serum, for medical or pharmaceutical applications. The absorbent can be produced with consistent quality from readily available synthetic peptides. The peptides of the invention bind the specified materials with high affinity and selectivity This invention describes a novel selective adsorbent for binding immune

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention comprises a test set for characterizing substrate specificities of kinases, consisting of two peptide pools, in which every peptide in each of the peptide pools contains one phosphorylatable amino acid position, one query amino acid position, at least one anchor amino acid position, and at least one degenerate amino acid position, and at least one degenerate amino acid position. The test set of the invention is useful to determine the spectrum of peptidyl sequences that are phosphorylated by a kinase. The present amino acid sequence represents a peptide that was used as a substrate for a protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Test set useful for characterizing substrate specificities of kinases, comprises two peptide pools, in which every peptide in each of the peptide pools has phosphorylatable, query, anchor and degenerate amino acid positions.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention comprises a test set for characterizing substrate specificities of kinases, consisting of two peptide pools, in which every peptide in each of the peptide pools contains one phosphorylatable amino acid position, one query amino acid position, at least one anchor amino acid position, and at least one degenerate amino acid position. The test set of the invention is useful to determine the spectrum of peptidyl sequences that are phosphorylated by a kinase. The present amino acid sequence represents a peptide that was used as a substrate for a protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Novel dengue virus antibody-related 3C1 heavy chain CDR3 peptide SeqID39.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        antibody engineering, flavivirus infection, diagnostic, pharmaceutical, virucide, antiviral, 3C1.
                                                                                                                                                                                                                                                                                Test set useful for characterizing substrate specificities of kinases, comprises two peptide pools, in which every peptide in each of the peptide pools has phosphorylatable, query, anchor and degenerate amino acid positions.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ;

binding of protein subunits of ribonucleic acid polymerase.
```

The invention relates to methods of interfering with bacterial life cycle by bringing bacterial cells into contact with a compound that blocks the binding of at least one protein subunit of ribonucleic acid polymerase (RNAP) to a second protein subunit of RNAP. The methods can be used for obtaining compounds which inhibit subunit interactions and assembly necessary for enzyme function in bacteria. The compounds inhibit the binding of (a) at least one protein subunit of RNAP to a second and blocks a nucleic acid binding to the beta-subunit of RNAP core; subunit of RNAP. The compounds obtained can be used as anti-bacterial subunit of RNAP. The compounds obtained can be used as anti-bacterial gutaive nucleic acid binding softeness of the conserved from the putative nucleic acid binding sequences of the conserved region A of E. coli beta 'subunit. The antibacterial compounds that block nucleic acid binding softeness of the conserved region A of E. coli beta 'subunit. The antibacterial compounds that block nucleic acid binding to the RNAP bind to the sequences indicated Claim 27; Page 63; 106pp; English.

Sau ribosomal protein slip (rpslip) PAB0362 - Pyrococcus abyssi (strain Orsay)
C,Species: Pyrococcus abyssi
C,Date: 20-Aug-1999 #sequence_revision 20-Aug-1999 #text_change 09-Jul-2004
C,Accession: D75171
R,Anonymous, Genoscope
submitted to the EMBL Data Library, July 1999
A,Description: Pyrococcus abyssi genome sequence: insights into archaeal chromosome struc
A,Reference number: A75001
A,Reference number: A7501
A,Reference preliminary
A,Accession: D75171
A,Reference DNA
A,Rococcus type: DNA
A,Rococcus type:
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    probable ribosomal protein S11 - Pyrococcus horikoshii

probable transposase for IS1016 NWA1487 [imported] - Neisseria meningitidis (strain 2249] C;Species: Neisseria meningitidis
C;Date: 05-May-2000 #sequence_revision 05-May-2000 #text_change 09-Jul-2004
C;Accesion #181840
R;Parkhill, J.; Achtman, M.; James, K.D.; Bentley, S.D.; Churcher, C.; Klee, S.R.; Morell ; Holroyd, S.; Jägels, K.; Leather, S.; Moule, S.; Mungall, K.; Quail, M.A.; Rajandream, Nature 404, 502-506, 2000
A;Title: Complete DNA sequence of a serogroup A strain of Neisseria menigitidis Z2491.
A;Accession: A81840
A;Status: preliminary
A;Molecule type: DNA
A;Residues: 1-197 <PAR>
A;Accession: 1-197 <PAR>
A;Accession: 1-197 <PAR>
A;Cross-references: UNIPROT:09JU54; UNIPARC:UDI0000C4BE8; GB:AL162756; GB:AL157959; NID: C;Genetios:
A;Gene: NMA1487
